Lab 13 Vectors

Goals

By the end of this lab you should:
- Be familiar with vectors

String splitter
Given the following header:

`vector<string> split(string target, string delimiter);`

implement the function `split` so that it returns a vector of the strings in target that are separated by the string delimiter. For example:

`split("10,20,30", ",")`

should return a vector with the strings "10", "20", and "30". Similarly,

`split("do re mi fa so la ti do", " ")`

should return a vector with the strings "do", "re", "mi", "fa", "so", "la", "ti", and "do".

Note: There should be no cout statements within the function definition
